SEI activity integration (display 22904)

What it is

An HTTP entry integration. Grow runs it on the server each time someone submits the form. It sends one request to ZMP that records a `preference_center` event and updates the person.

`identify_person: true` makes the same call create or update the subscriber, so no separate identify request is needed.

Where it sends

Mode	URL
Live	`POST https://api.zetaglobal.net/ver2/sei-soccer-com/activities`
Staging preview (`stageMode=true`)	`POST https://api.zetaglobal.net/ver2/sei-dev/activities`

Auth is a ZMP Basic header, `Basic base64("api:<ZMP REST key>")`. The repo copy has a placeholder; the real header lives only in Grow and the gitignored `WIPactivity.json`.

Settings that matter

Setting	Effect
`required: ["email"]`	No email in the entry, no request.
`paramsType: mapped`, **`formatType: structured`**	The `params` object is sent as nested JSON.
`ignoreEmpty: true`, **`nullHandling: omit`**	Empty values are dropped instead of sent as `""` or `null`.
`logDebug: true`	Request and response show in Grow's integration log.

Payload

Shape only; `…` stands for the mapped fields below.

```
{
  "activity": {
    "identify_person": true,
    "event": "preference_center",
    "subscriber": {
      "uid": "<email>",
      "first_name": "…", "last_name": "…", "source": "grow",
      "contacts": [{
        "contact_type": "email", "contact_value": "<email>", "subscription_status": "active"
      }],
      "properties": { "first_name", "last_name", "date_of_birth", "email", "pref_center_* …" }
    },
    "properties": { "source": "grow", "subscription_status": "active", "…same fields as above" }
  }
}
```

The person's fields go in `subscriber.properties`. The event gets a copy in `activity.properties`, so the submit is visible on the event too.

Field mapping

ZMP field	Form field
`uid`, email contact	`email` (falls back to `uid`)
`first_name`	`name_Firstname`
`last_name`	`name_Lastname`
`date_of_birth`	`date_of_birth`
`pref_center_parent`, `_coach_admin`, `_player`, `_fan`	`I_am_a` checkboxes
`pref_center_cleats_and_shoes`, `_fan_jerseys_and_gear`, `_apparel`, `_soccer_balls_and_equipment`, `_goalkeeper`, `_new_content_and_articles`, `_deals_and_special_offers`	`My_preferences` checkboxes

Each preference flag is `Y` when its choice id is in the checked list and `N` otherwise:

```
${((params.I_am_a ?: entry.I_am_a ?: '') as String).contains('parent') ? 'Y' : 'N'}
```

Every flag is always sent, so unchecking a box writes `N`.

Things to watch

Symptom	Cause
Every `pref_center_*` is `N`	The checkbox field names changed in Grow. The JSON must read `I_am_a` / `My_preferences`; it used to read `multioptin` / `multioptin_01`.
Name or DOB missing in ZMP	The form field was empty. Empty values are omitted, so ZMP keeps the old value.
Nothing reaches ZMP	No email in the entry (`required`), or the integration is not attached to this display.
Wrong site written	Staging previews post to `sei-dev`; live traffic posts to `sei-soccer-com`.
"Latest product drops" not saved	`latest_product_drops` has no ZMP property yet, so it is not mapped.

Checking a submit

Look the person up in ZMP and confirm `last_updated_source` is `grow` with a fresh `last_updated`:

```
curl -sS -H "Authorization: Basic <base64 api:key>" -H "Accept: application/json" \
  "https://api.zetaglobal.net/ver2/sei-dev/subscribers?uid=sei.dev.pc.003%40example.invalid"
```
